

Fentanyl...

What is it?

What is it?

What is it?

What is it?

Fentanyl is the most powerful prescription painkiller available in America.

What does it do?

What does it do?

What does it do?

What does it do?

It is a synthetic opioid primarily used to treat severe post-operative pain and for patients suffering from debilitating pain experienced during end-stage cancer.

Also, it is a short-acting Schedule II Opioid that is...

50x More Potent than Heroin

Fentanyl

100x More Potent than Morphine

Fentanyl

and the drug is abused for intense periods of euphoria and can be...

Swallowed

Snorted

Injected

The Dangers of Fentanyl

Just a **1/4 of a milligram** of fentanyl is enough to be fatal. With heroin and prescription opioids now being laced with unknown quantities of the drug, there has been a spike in fentanyl-related deaths in recent years.

- From 2013 - 2014, there were more than 700 overdose deaths related to fentanyl and its analogs.
- On March 18, the Drug Enforcement Administration issued a nationwide alert to all U.S. law enforcement about the drug.
- On October 26, 2015, the Centers for Disease Control and Prevention released an official health advisory about the dangers of fentanyl.
- The number of fentanyl seizures by U.S. law enforcement increased nearly 400 percent from 2013 - 2014.

Known Fentanyl Analogs

Because fentanyl is a drug that must be legally prescribed, rogue chemists have been creating analogs of it to mimic the drug's effects while evading law enforcement.

There are several known fentanyl analogs on the market. They include:

- 3-Methylfentanyl (TMF)
- 3-Methylthiofentanyl
- Acetyl Fentanyl
- Alpha-Methylfentanyl
- Para-Fluorofentanyl
- Beta-Hydroxyfentanyl
- Acetyl-Alpha-Methylfentanyl
- Beta-Hydroxy-3-Methylfentanyl
- Remifentanyl
- Sufentanyl
- Thiofentanyl
- Ocfentanyl
- Carfentanyl
- Butyrfentanyl
- Alfentanyl
